

The Project

Develop a backend web based application using Laravel that provides CRUD capabilities through exposed REST APIs on the following entities:

1. Customer
2. Service

Each customer can have many services; you are free to choose the fields of the entities as appropriate.

Your project should be uploaded to Github showing all the history commits.

Required Features

1) The Customer APIs should provide the following features:

- Create a customer
- View a customer
- View all customers
- Update a customer
- Delete a customer

2) The Service APIs should provide the following features:

- Create a service for a customer
- View services of a customer
- View all services
- Update a service
- Delete a service

3) Each API endpoint must be protected using Basic Authentication.

Required Technologies

Must:

- PHP
- Laravel Framework

- Authentication
- ORM
- MSSQL Server or any other SQL Server
- Swagger

Bonus points

- Unit test coverage
- Cache the services using a caching technology of your choice.
- Secure the services using JWT/OAuth
- Dockerize the spring boot application
- Integrate the repo with CI/CD
